Pseudocoding and Problem Solving

—

By Julian Fee

Lab 4 Pseudocode

The image above is a screenshot from my pseudocode. My first, everyday, pseudocode task was how to make the perfect fried egg. The second task, the computer pseudocode task was creating the Chrome Dino Jump game.

Lab 4: Pseudocoding and Problem Solving.

Challenges:

Lab 4 was a little bit confusing from the start. Althought I had previously taken Javascript before I was having a hard time figuring out what exactly we should be doing. I began to do some research regarding simple games to write in Javascript, however I began to get confused when it came to linking it all together. I looked at a simple puzzle from an image, a crossword puzzle, chess, checkers, tic-tac-toe, and I couldn't find what I was looking for.

Problems:

I had a hard time finding a code that made enough sense to me that I could break it down into pseudocode. After reading many different codes posted online and looking at the developer source, I decided to look for one of the most simple games I could think of; the Chrome Dino Jump.

Results:

I finally decided on trying to replicate the Chrome Dino Jump game. I copied and pasted the js, css, and html code into the correct folders, downloaded and renamed the images, but I had no luck on getting anything to show up. Hopefully looking at it more and better understanding Javascript and how everything links together, I will be able to sucessfully replicate the Dino Jump.

Lab 4

Here is the screenshot of the challenges, problems, and concerns that I encountered while working through Lab 4. I, again, messaged multiple people across multiple platforms with no response regarding partnering up for this lab. I do not want to pester or message multiple times as that can seem creepy. I have messaged Wes as to what I should do about this issue. Sorry for not being able to partner up and do the lab correctly.
